RE: 09/732,081

There is no valid CRF for this Serial Number. Please provide us with another Serial Number from the Parent Application.

**LEONARD 22520**

To:

STIC-Biotech/ChemLib

**Subject:** 09/732,081 Importance:

Please search SEQ ID NO 3 and 4 with respect to polypeptides/proteins. The nucleic acid should be back translated to the polypeptide. Thanks.

disorder or disease associated with infection of an animal with Helicobacter. Pharmaceutical composition and vaccines comprising the sequences of the invention is useful for treating type B gastritis, peptic ulcers, gastric cancers such as adenocarcinoma, and low grade B cell lymphoma. The invention is useful as reagents for clinical or medical diagnosis of Helicobacter infections and for scientific research on the properties of pathogenicity, virulence and infectivity of Helicobacter, as well as host defense mechanisms. The present sequence is Helicobacter sp. PQE/HP30 protein
                                                                                                                                                                                                                                                                                           61 IABELQYYGSNSPASFIKGEGVLYKEILCDVCDKLKVNYNKKTETTLIEQNMLSKILERS 120

Helicobacter pylori nucleic acid sequences and related polypeptide(s) useful for vaccines to treat or prevent H. pylori infection, and to detect Helicobacter. Mellgaerd BL; or, Berglindh 1997-052306/05 WPI; 1997-052306/ N-PSDB; AAT67811 Smith D,

The invention relates to Helicobacter HP30 or HP56 polypeptide and peptides derived from them. The invention is useful for producing an immune response. It is useful for preventing, treating or ameliorating a

el Helicobacter proteins, HP30 and HP56, and nucleic acids encoding proteins, useful as vaccines for raising immune response in animals.

The present sequence is a H. pylori cytoplasmic protein. The protein may identify H. pylori polypeptide binding compounds, useful as potential H. pylori life cycle activators or inhibitors. The genomic sequence of H. pylori life cycle activators or inhibitors. The genomic sequence of H. pylori (ATCC 55679) was determined from overlapping contigs generated by mechanically shearing the bacterial DNA. The sequences were analysed for ORF of at least 180 mucleotides, and the predicted coding regions defined by computer evaluation. To identify likely H. pylori antigens for vaccine development, the amino acid sequences predicted from various ORF were analysed for significant homology to other known or exported membrane proteins. Having identified and determined the sequences of interest;
                                                                                                                                                                                                                                                                                                                                                                                           particular regions can be isolated from H. pylori by PCR amplification for recombinant polypeptide production, e.g. in E. coli hosts

```
compounds, especially activators or inhibitors of bacterial life cycle, for the ability to bind an H. pylori nucleic acid sequence. The nucleic acid sequences, and corresponding proteins, are also useful for acid sequences, and corresponding proteins, are also useful for modelecting the presence of Helicobacter species in a sample. Antisense in detecting the presence of Helicobacter species in a sample. Antisense mucleic acid sequences of these sequences are used to inhibit expression of a gene from Helicobacter species. H. pylori whole genomic DNA was isolated and nebulised to a median size of 2000 bp. Purified DNA fragments were blunt-ended and ligated to unique BstXI-linker adapters in 100-1000 fold molar excess. These linkers are complementary to the BstXI-cut pMFX vectors, while the overhang is not self-complementary. Therefore the linker sull not concatemerise nor will the cut vector re-ligate itself easily. The linker adapter inserts were ligated to each of the 20 pMFX vectors to construct a series of shotgun subclone libraries. The purified DNA samples were then sequenced. Note: The ORR protein reference number for this sequence was obtained from the related specification,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                              This sequence represents an H. pylori cytoplasmic protein. Helicobacter pylori has been strongly linked to chronic gastritis and duodenal ulcer disease. The nucleic acid sequences of the invention are used to evaluate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         120

The present sequence is a H. pylori cytoplasmic protein. The protein may be used in a vaccine to prevent or treat H. pylori infection or to identify H. pylori polypeptide binding compounds, useful as potential H. pylori life cycle activators or inhibitors. The genomic sequence of H. pylori life cycle activators or inhibitors. The genomic sequence of H. pylori (ATCC 55679) was determined from overlapping contigs generated by methanically shearing the bacterial DNA. The sequences were analysed for by computer evaluation. To identify likely H. pylori antigens for vaccine by computer, the amino acid sequences predicted room various ORF were analysed for significant homology to other known or exported membrane analysed for significant homology to other known or exported membrane proteins. Having identified and determined the sequences of interest, particular regions can be isolated from H. pylori by PCR amplification for recombinant polypeptide production, e.g. in B. coli hosts

Interacts with the secY/secE subunits. SecA has a central role in coupling the hydrolysis of ATP to the transfer of pre-secretory periplasmic and outer membrane proteins across the membrane (By similarity). SUBUNIT: Part of the prokaryotic procein translocation apparatus which comprise secA, secB, secB, secE, secG, and secY (By

-!- COFACTOR: Pyridoxal phosphate (By similarity).
-!- PATHWAY: Biotin biosynthesis; first step.
-!- SIMILARITY: Belongs to class-II of pyridoxal-phosphate-dependent aminotransferases.
